

MATH 223

Some Notes on Assignment 29
Exercises 23 and 30 of Chapter 7.

23 Find the surface area of a circular cylinder of radius r and height h by rotating the graph of $f(x) = r, 0 \leq x \leq h$ about the x -axis.

Solution: Using the parametrization $g(t) = (t, r), 0 \leq t \leq h$, we have $g'(t) = (1, 0)$ so $|g'(t)| = 1$ and surface area is $\int_0^h 2\pi r dt = 2\pi rh$.

30: Sketch the solid obtained by revolving the graph of $y = 4\sqrt[3]{x}$ from $(8, 8)$ to $(27, 12)$ around the y -axis and determine its surface area.

Solution: Let $g(t) = (t, 4\sqrt[3]{t}), 8 \leq t \leq 27$ be the parametrization. Then $g'(t) = (1, \frac{4}{3}t^{-2/3}) = (1, \frac{4}{3t^{2/3}})$ so

$$|g'(t)| = \sqrt{1 + \frac{16}{9t^{4/3}}} = \frac{\sqrt{9t^{4/3} + 16}}{3t^{2/3}}$$

Then the surface area obtained by revolving about the y axis is

$$\begin{aligned} \int_8^{27} 2\pi t \frac{\sqrt{9t^{4/3} + 16}}{3t^{2/3}} dt &= 2\pi \int_8^{27} t^{1/3} \sqrt{9t^{4/3} + 16} dt \\ &= 2\pi \frac{1}{54} \left[(9t^{4/3} + 16)^{3/2} \right]_8^{27} \\ &= \frac{\pi}{27} (745^{3/2} - 160^{3/2}) \end{aligned}$$

Exercise A: A curve γ has the parametrization $g(t) = (t, 4\cos t, 4\sin t)$ Sketch the curve, find its curvature and show it is constant.

Solution: We have $g'(t) = (1, -4\sin t, 4\cos t)$ so $|g'(t)| = \sqrt{1 + 16\sin^2 t + 16\cos^2 t} = \sqrt{1 + 16} = \sqrt{17}$. Thus the unit tangent vector is $T = \frac{1}{\sqrt{17}}(1, -4\sin t, 4\cos t)$ and $T' = \frac{1}{\sqrt{17}}(0, -4\cos t, -4\sin t)$ so $|T'| = \frac{1}{\sqrt{17}}\sqrt{0 + 16\cos^2 t + 16\sin^2 t} = \frac{4}{\sqrt{17}}$. This curvature is $\kappa = \frac{|T'|}{|g'|} = \frac{4}{\sqrt{17}} \frac{1}{\sqrt{17}} = \frac{4}{17}$.

Graph of $g(t) = (t, 4\cos t, 4\sin t), -2\pi \leq t \leq 2\pi$ Graph of $g(t) = (t^2, t), -2 \leq t \leq 2$

Exercise B: Sketch the curve with parametrization $g(t) = (t^2, t), -2 \leq t \leq 2$ and find its curvature at $t = 0$ and at $t = \sqrt{6}$.

Solution: . We have $g'(t) = (2t, 1), |g'(t)| = \sqrt{1 + 4t^2}$ so

$$T(t) = \left(\frac{2t}{\sqrt{1 + 4t^2}}, \frac{1}{\sqrt{1 + 4t^2}} \right) \text{ with } T'(t) = \left(\frac{2}{\sqrt{1 + 4t^2}^{3/2}}, \frac{-4t}{\sqrt{1 + 4t^2}^{3/2}} \right) \text{ and } |T'(t)| = \frac{2}{1 + 4t^2}$$

$$\text{Thus } \kappa(t) = \frac{2}{1 + 4t^2} \frac{1}{\sqrt{1 + 4t^2}} = \frac{2}{(1 + 4t^2)^{3/2}}$$

which makes $\kappa(0) = 2$ and $\kappa(\sqrt{6}) = \frac{2}{(1+24)^{3/2}} = \frac{2}{5^3}$.

Exercise C: Suppose the curve C in the plane is the graph of the real-valued function $y = f(x)$ of one variable. Show that its curvature is

$$\frac{|f''(x)|}{(1 + |f'(x)|^2)^{3/2}}$$

Solution: To simplify the notation, we'll use F for the first derivative f' and S for the second derivative f'' , simply writing f for $f(x)$, F for $f'(x)$, and S for $f''(x)$.

Then the parametrization $g(x) = (x, f(x))$ has $g' = (1, F)$ so $|g'| = \sqrt{1 + F^2}$. Then

$$T = \left(\frac{1}{\sqrt{1 + F^2}}, \frac{F}{\sqrt{1 + F^2}} \right) \text{ and } T' = \left(\frac{-FS}{(1 + F^2)^{3/2}}, \frac{S}{(1 + F^2)^{3/2}} \right)$$

(leaving out some intermediate steps in calculating T') which makes

$$|T'| = \sqrt{\frac{F^2 S^2 + S^2}{(1 + F^2)^3}} = \sqrt{\frac{S^2(1 + F^2)}{(1 + F^2)^3}} = \sqrt{\frac{S^2}{(1 + F^2)^2}} = \frac{|S|}{1 + F^2}$$

$$\text{Thus } \kappa = \frac{|T'|}{|g'|} = \frac{|S|}{1 + F^2} \frac{1}{\sqrt{1 + F^2}} = \frac{|S|}{(1 + F^2)^{3/2}} = \frac{|f''(x)|}{(1 + [f'(x)]^2)^{3/2}}$$

Exercise D: If C is a curve in 3-dimensional space with parametrization $g(t)$, show that its curvature is given by

$$\frac{|g'(t) \times g''(t)|}{|g'(t)|^3}$$

Solution: Note first that $|T| = 1$ so $T \cdot T = |T|^2 = 1$. Taking the derivative of both sides with respect to t , we have $T \cdot T' + T' \cdot T = 0$ or $2T \cdot T' = 0$. Hence T and T' are orthogonal to each other.

Next note that $T = \frac{g'}{|g'|}$ so $g' = |g'|T$. To get g'' into the picture, differentiate this last equation with respect to t using the Product Rule:

$$g'' = |g'|T' + |g'|'T. \text{ Note that } |g'| \text{ and } |g'|' \text{ are scalars.}$$

Then

$$g' \times g'' = g' \times (|g'|T' + |g'|'T) = g' \times |g'|T' + g' \times |g'|'T$$

Now use $g' = |g'|T$ and that $|g'|$ and $|g'|'$ are scalars to write

$$g' \times g'' = |g'|T \times |g'|T' + |g'|T \times |g'|'T = |g'| |g'|T \times T' + |g'| |g'|'T \times T$$

Now $T \times T$ is zero T is parallel to itself so

$$g' \times g'' = |g'| |g'| (T \times T') \text{ so } |g' \times g''| = |g'|^2 |T \times T'|$$

But T and T' are orthogonal so the angle θ between them is $\pi/2$. Thus

$$|g' \times g''| = |g'|^2 |T| |T'| \sin \pi/2 = |g'|^2 |T| |T'| 1 = |g'|^2 |T'| \text{ since } |T| = 1$$

Dividing through by $|g'|^3$ gives

$$\frac{|g'(t) \times g''(t)|}{|g'(t)|^3} = \frac{|T'|}{|g'|} = \kappa$$
